

UAT Checklist — REQ-038

What's being tested: Restocking sellable drinks (bottles, cans, etc.) from an expense, and locking the unit of measure so it can't be entered wrong.

Issue: #84

Date: 2026-05-17

UAT site: <https://wawagardenbar-uat.up.railway.app/>

Tester: _____

Time started: _____ **Time finished:** _____

Before you start — read this once

1. **Open a Word document** called `REQ-038-UAT-Evidence-<your-name>-2026-05-18.docx`. You'll paste screenshots into it as you go. Use the section headings in this checklist as headings in the Word doc.
2. **You will need a screenshot tool.** On Windows: press `Windows key + Shift + S`. On Mac: press `Cmd + Shift + 4`. After capturing, paste into Word with `Ctrl + V` (or `Cmd + V` on Mac).
3. **Log in as a super-admin user** at <https://wawagardenbar-uat.up.railway.app/> using the credentials given to you. If you can't log in, stop and ask the developer.
4. **Tick each box below** as you finish that step. If something doesn't match what's described, **don't tick it** — write what you saw underneath it in the Word doc and continue.
5. **Two items you'll need in the menu before you start** (ask the developer to seed these if they aren't already there):
 - **Item A** — a drink sold in **bottles** (e.g. "Corona 330ml")
 - **Item B** — a drink sold in **cans** (e.g. "Coca-Cola 330ml")

Both must have **"Track inventory"** enabled.

Part 1 — Set the Purchase unit on a menu item (Item A — Bottles)

What this proves: The new "Purchase unit" dropdown saves correctly and survives a page reload.

Step 1.1 — In the left sidebar, click **Menu**.

Step 1.2 — In the list, click the row for **Item A** (your bottled drink).

Step 1.3 — Click the **Edit** button (top-right of the page).

Step 1.4 — Scroll down until you see a field labelled **"Unit Type"**. **Directly below it** there should be a new dropdown labelled **"Purchase unit"**.

- ☐ **CHECK:** The "Purchase unit" dropdown exists.
- ☐ **EVIDENCE:** Screenshot the whole form section showing the new dropdown. Paste into Word under heading "**1.4 — Purchase unit dropdown exists (Item A)**".

Step 1.5 — Click the "Purchase unit" dropdown. A list of units should appear (Bottles, Cans, Kegs, etc., plus "Any").

- ☐ **CHECK:** The list includes at least **Bottles**, **Cans**, and **Any**.
- ☐ **EVIDENCE:** Screenshot the open dropdown. Paste into Word under "**1.5 — Available units**".

Step 1.6 — Click **Bottles**. The dropdown should close and show "Bottles" as the selected value.

Step 1.7 — Scroll to the bottom and click the **Save** button (or **Update**).

- ☐ **CHECK:** You see a success message (e.g. "Menu item updated") and the page reloads or returns you to the menu list.
- ☐ **EVIDENCE:** Screenshot the success message. Paste into Word under "**1.7 — Save confirmation**".

Step 1.8 — Click **Item A** again in the list, then click **Edit**.

- ☐ **CHECK:** The "Purchase unit" dropdown still shows **Bottles** (the value persisted).
- ☐ **EVIDENCE:** Screenshot the form showing Bottles still selected. Paste into Word under "**1.8 — Bottles persisted after reload**".

Part 2 — Repeat for Item B (Cans) — proves the dropdown is generic

What this proves: The dropdown isn't hard-coded to one unit type.

Step 2.1 — In the sidebar, click **Menu** → click **Item B** → click **Edit**.

Step 2.2 — Set the **Purchase unit** dropdown to **Cans** → click **Save**.

Step 2.3 — Reopen the same item.

- ☐ **CHECK:** "Purchase unit" still shows **Cans**.
- ☐ **EVIDENCE:** Screenshot. Paste into Word under "**2.3 — Cans persisted on Item B**".

Part 3 — Add a brand-new unit and confirm it appears in the dropdown

What this proves: When the bar adds a new unit type (e.g. Kegs), it shows up automatically.

Step 3.1 — In the sidebar, click **Settings** → look for a section called **Units of Measurement**. (If you can't find it, ask the developer to point you there.)

Step 3.2 — Click **Add new unit** (button name may be slightly different) and create a unit called "**TestKegs-<your initials>**" (e.g. "TestKegs-JS"). Save it.

- ☐ **EVIDENCE:** Screenshot the new unit row in the list. Paste under "**3.2 — New unit created**".

Step 3.3 — Go back to **Menu** → click **Item A** → click **Edit** → open the **Purchase unit** dropdown.

☐ **CHECK:** Your new unit "**TestKegs-<initials>**" appears in the list (you do **not** need to pick it — just confirm it's listed).

☐ **EVIDENCE:** Screenshot the open dropdown showing the new unit. Paste under "**3.3 — New unit appears in dropdown**".

Step 3.4 — Close the form **without saving** (so Item A stays on Bottles).

Part 4 — Expense form: kitchen dropdown + sellable checkbox layout

What this proves: The expense form has two separate "add to inventory" controls — one always-visible dropdown for kitchen ingredients, plus a checkbox below it that reveals a sellable-only dropdown. The two are mutually exclusive (picking one disables the other).

Step 4.1 — In the sidebar, click **Finance** → **Expenses** (URL: `/dashboard/finance/expenses`).

Step 4.2 — Click the **" + Add Expense "** button (top-right) to open the Add Expense dialog.

Step 4.3 — In the dialog, leave Date as today. Under **Line Items**, in the existing line: pick Type **Direct Cost (COGS)**, pick any Category, type Description "UAT inventory link test", set Qty 1. **Stop before clicking Save Expense** — you are inspecting the form layout.

Step 4.4 — Look at the line item. **Below** the Description / Qty / Unit / Unit Cost / Total row you should see **two controls**:

- A **dropdown** labelled **"Add to kitchen inventory (optional)"**, defaulting to **"No inventory link"**.
- Below it, a **checkbox** labelled **"Update inventory count (sellable item)"**, unticked by default.

☐ **CHECK:** Both controls are visible (one dropdown + one checkbox, in that order).

☐ **EVIDENCE:** Screenshot the line item showing both controls. Paste under "**4.4 — Kitchen dropdown + sellable checkbox visible**".

Step 4.5 — Click the **"Add to kitchen inventory (optional)"** dropdown and pick any kitchen ingredient from the list.

☐ **CHECK:** Your pick is shown in the dropdown, AND the **"Update inventory count (sellable item)"** checkbox below either becomes disabled / greyed-out or cannot be ticked.

☐ **EVIDENCE:** Screenshot the line item with a kitchen ingredient selected. Paste under "**4.5 — Kitchen picked → sellable checkbox disabled**".

Step 4.6 — Set the kitchen dropdown back to **"No inventory link"**.

Step 4.7 — Tick the **"Update inventory count (sellable item)"** checkbox.

☐ **CHECK:** A new dropdown labelled **"Sellable item to restock"** appears below the checkbox, AND the kitchen dropdown above becomes disabled / greyed-out.

☐ **EVIDENCE:** Screenshot the line item with the sellable checkbox ticked. Paste under "**4.7 — Sellable ticked → kitchen dropdown disabled + sellable dropdown appears**".

Part 5 — Unit lock when picking a sellable with a Purchase unit set

What this proves: When you pick a sellable item that has "Purchase unit = Bottles" set, the expense Unit field is forced to Bottles. You can't accidentally enter Cans.

Step 5.1 — With "Update inventory count (sellable)" still ticked, open the "**Sellable item to restock**" dropdown.

Step 5.2 — Pick **Item A** (your Bottles drink).

Step 5.3 — Look at the **Unit** field on the same line.

☐ **CHECK:** The Unit field is now **locked to "Bottles"** (greyed out, disabled, or read-only). You should also see a tooltip or helper text explaining why.

☐ **EVIDENCE:** Screenshot the line item with the locked Unit field. Paste under "**5.3 — Unit locked to Bottles when Item A is picked**".

Step 5.4 — Try clicking the Unit field and typing "**Cans**" or selecting Cans from a dropdown.

☐ **CHECK:** You **cannot** change it — the field is locked.

☐ **EVIDENCE:** Screenshot showing you couldn't change it. Paste under "**5.4 — Cannot override the locked unit**".

Step 5.5 — Change the dropdown selection from Item A to **Item B** (your Cans drink).

☐ **CHECK:** The Unit field now automatically updates to "**Cans**".

☐ **EVIDENCE:** Screenshot the Unit field showing Cans. Paste under "**5.5 — Unit auto-locks to Cans for Item B**".

Part 6 — Full restock flow (end-to-end with quantity 24)

What this proves: When the expense is approved and transferred, the inventory count for Item A goes up by the right amount.

Step 6.1 — First, **note the current stock** of Item A. Open a **second browser tab** → in the sidebar, click **Inventory** → find Item A → write down the **current stock** number here:

☐ **EVIDENCE:** Screenshot the inventory list showing Item A's current stock. Paste under "**6.1 — Item A stock BEFORE expense**".

Step 6.2 — Switch back to the expense tab. Make sure:

- "Update inventory count (sellable)" is **ticked**
- "Sellable item to restock" is **Item A**
- **Quantity** is **24**
- Unit shows **Bottles** (locked)
- Amount is **£100**

Step 6.3 — Click **Submit** (or **Save**) on the expense.

☐ **EVIDENCE:** Screenshot the saved/pending expense row. Paste under "**6.3 — Expense submitted**".

Step 6.4 — Approve the expense (you should be super-admin) → then **Confirm transfer** (enter any reference like "UAT-2026-05-18-REQ-038").

☐ **EVIDENCE:** Screenshot the transferred expense status. Paste under "**6.4 — Expense transferred**".

Step 6.5 — Switch to your second browser tab → refresh **Inventory** → find Item A again.

☐ **CHECK:** Item A's **current stock has increased by exactly 24** (from the value you wrote down in Step 6.1).

☐ **EVIDENCE:** Screenshot the inventory list showing the new stock value. Paste under "**6.5 — Item A stock AFTER expense (+24)**".

Part 7 — Edit-and-revise (proves reversal works)

What this proves: If you correct the quantity on an already-transferred expense, the inventory count adjusts correctly.

Step 7.1 — Go back to the transferred expense from Part 6 → click **Edit** → change the **Quantity** from 24 to **30** → save.

Step 7.2 — Refresh Inventory. Item A's stock should now be the original (Step 6.1) + 30 (not 24 + 30 = 54 — that would be a bug).

☐ **CHECK:** Stock = Step 6.1 original + 30.

☐ **EVIDENCE:** Screenshot inventory after edit. Paste under "**7.2 — Stock after edit (+30, not 24+30)**".

Step 7.3 — Delete the expense → refresh Inventory.

☐ **CHECK:** Stock returns to the **original Step 6.1 value** (the +30 is reversed).

☐ **EVIDENCE:** Screenshot inventory after delete. Paste under "**7.3 — Stock returns to original after delete**".

Part 8 — Customer menu hasn't broken

What this proves: The customer-facing menu still works normally — nothing about restock leaks to customers.

Step 8.1 — Open a **private/incognito browser window** → go to the public menu (ask developer for the exact URL — usually `https://wawagardenbar-uat.up.railway.app/` or `/menu`).

Step 8.2 — Find Item A on the menu.

☐ **CHECK:** Item A appears normally with its price. There is **no** mention of "Purchase unit", "restock", or "inventory count".

☐ **EVIDENCE:** Screenshot the customer menu showing Item A. Paste under "**8.2 — Customer menu unchanged**".

Part 9 — Sign-off

Once every checkbox above is ticked, fill in the sign-off table below in your Word doc and email it to the developer.

Item	Result
All Part 1 boxes ticked (Purchase unit saves on Item A)	PASS / FAIL
All Part 2 boxes ticked (works on Item B too)	PASS / FAIL
All Part 3 boxes ticked (new unit appears in dropdown)	PASS / FAIL
All Part 4 boxes ticked (kitchen dropdown + sellable checkbox + mutex)	PASS / FAIL
All Part 5 boxes ticked (unit lock works for Bottles and Cans)	PASS / FAIL
All Part 6 boxes ticked (full restock +24 lands on inventory)	PASS / FAIL
All Part 7 boxes ticked (edit + delete reversal works)	PASS / FAIL
All Part 8 boxes ticked (customer menu unchanged)	PASS / FAIL

Tester name: _____

Date: _____

Signature: _____

Overall result (circle one): PASS / FAIL

If FAIL: write below which Part failed and what you saw instead.

What to do when finished

1. Save the Word doc.
2. Email it to the developer with subject "**REQ-038 UAT evidence — <your name> — 2026-05-18**".
3. Stop. The developer will record the UAT result on their side.
