

UAT Checklist — REQ-040

What's being tested: A safety guard that stops two developer scripts from accidentally writing to the wrong database. **The guard itself is a behind-the-scenes change with no UI** — there is nothing visible on the website to test. The tester's job for this requirement is to confirm **the website still works normally**, then sign off.

Issue: #89

Date: 2026-05-17

UAT site: <https://wawagardenbar-uat.up.railway.app/>

Tester: _____

Time started: _____ **Time finished:** _____

Before you start — read this once

1. **Open a Word document** called `REQ-040-UAT-Evidence-<your-name>-2026-05-18.docx`. You will paste a few screenshots into it as you go.
 2. **Screenshot tool:** Windows → `Windows + Shift + S`. Mac → `Cmd + Shift + 4`. Paste with `Ctrl + V` / `Cmd + V`.
 3. **Log in as a super-admin user** at <https://wawagardenbar-uat.up.railway.app/>.
 4. **What this requirement is (in plain English):** The developer added a small piece of code that checks the database connection string before two developer-only scripts run. If the string is missing the database name, the script refuses to run. This protects against running a script against the wrong database by accident. **There is no new button, screen, or feature to test on the website.**
 5. **What you need to do:** A short smoke test to confirm the bundled release didn't accidentally break anything on the live site. **Then sign off.**
-

Part 1 — Site loads and the dashboard works

What this proves: The release didn't break the basic homepage or login.

Step 1.1 — Open a fresh browser tab and go to <https://wawagardenbar-uat.up.railway.app/>.

- ☐ **CHECK:** The page loads with no error message. You see the normal login page (or, if already logged in, the dashboard).
- ☐ **EVIDENCE:** Screenshot the page. Paste into Word under heading "**1.1 — Site loads**".

Step 1.2 — Log in (if you aren't already).

- ☐ **CHECK:** Login succeeds and you land on the dashboard.
- ☐ **EVIDENCE:** Screenshot the dashboard after login. Paste under "**1.2 — Login works, dashboard shown**".

Part 2 — Core admin pages still load

What this proves: The most-used admin pages didn't break.

For each page below, click the link in the sidebar and confirm the page loads without an error.

Step 2.1 — In the sidebar, click **Menu**.

- ☐ **CHECK:** The menu list loads. You can see at least one item.
- ☐ **EVIDENCE:** Screenshot. Paste under "**2.1 — Menu page loads**".

Step 2.2 — In the sidebar, click **Inventory**.

- ☐ **CHECK:** The inventory list loads.
- ☐ **EVIDENCE:** Screenshot. Paste under "**2.2 — Inventory page loads**".

Step 2.3 — In the sidebar, click **Inventory** → **Snapshots**.

- ☐ **CHECK:** The snapshots list loads.
- ☐ **EVIDENCE:** Screenshot. Paste under "**2.3 — Snapshots page loads**".

Step 2.4 — In the sidebar, click **Finance** → **Expenses** → **Pending**.

- ☐ **CHECK:** The pending expenses page loads.
- ☐ **EVIDENCE:** Screenshot. Paste under "**2.4 — Pending expenses page loads**".

Step 2.5 — In the sidebar, click **Reports** → **Daily**.

- ☐ **CHECK:** The daily report page loads.
- ☐ **EVIDENCE:** Screenshot. Paste under "**2.5 — Daily report page loads**".

Part 3 — Browser console has no fresh errors

What this proves: No new JavaScript errors were introduced.

Step 3.1 — While on any dashboard page, press **F12** to open developer tools (or right-click anywhere → **Inspect**) → click the **Console** tab.

Step 3.2 — Refresh the page (F5 / Cmd+R).

- ☐ **CHECK:** No red error messages appear after refresh. (Blue "info" and yellow "warning" messages are fine.)
- ☐ **EVIDENCE:** Screenshot the Console tab. Paste under "**3.2 — No console errors after refresh**".

Part 4 — Customer-facing menu still works

What this proves: The release didn't break the public-facing site.

Step 4.1 — Open a **private/incognito** browser window.

- Step 4.2** — Go to the customer menu URL (ask the developer for the exact path — usually `https://wawagardenbar-uat.up.railway.app/` or `/menu`).
- ☐ **CHECK:** The customer menu loads. Items are visible with prices.
 - ☐ **EVIDENCE:** Screenshot the customer menu. Paste under "**4.2 — Customer menu loads**".

Part 5 — Developer-only verification (NOT for the tester)

*This section is **for the developer** to fill in after merge. The tester does not need to do anything here — leave it blank and the developer will complete it.*

The developer will run both scripts (`scripts/backfill-inventory-kind.ts` and `scripts/audit-expense-link-units.ts`) locally against:

1. A **valid** UAT URI → must succeed and log the database name to stdout.
2. A **path-less** URI → must exit with code 1 and an error message **before opening a database connection**.

Developer verification step	Date	Initials
<code>scripts/backfill-inventory-kind.ts</code> — valid URI passes		
<code>scripts/backfill-inventory-kind.ts</code> — path-less URI fails		
<code>scripts/audit-expense-link-units.ts</code> — valid URI passes		
<code>scripts/audit-expense-link-units.ts</code> — path-less URI fails		

Note for developer: automated tests in `__tests__/lib/mongo-uri.test.ts` cover the parser matrix on every CI run. This manual section is a once-per-release smoke against the live UAT URI.

Part 6 — Sign-off

Item	Result
Part 1: site loads and login works	PASS / FAIL
Part 2: core admin pages all load	PASS / FAIL
Part 3: no fresh console errors	PASS / FAIL
Part 4: customer menu still works	PASS / FAIL

Tester name: _____

Date: _____

Signature: _____

Overall result (circle one): PASS / FAIL

If FAIL: write below which Part failed and what you saw instead.

What to do when finished

1. Save the Word doc.
2. Email it to the developer with subject "**REQ-040 UAT evidence — <your name> — 2026-05-18**".
3. Stop. The developer will fill in Part 5 (developer-only verification) and record the UAT result on their side.
